Yale School of Medicine Postgraduate Research Associate

Paid, full-time position, starting October 2019

This is a 9-12 month position with the possibility of extension for another year to work on basic research studies examining: 1) the effect of autoimmune disease on placental innate immune function and adverse pregnancy outcomes; and 2) the effect of antidepressants on fetal membrane function and adverse pregnancy outcomes. These studies will utilize a variety of human in vitro models including tissue and cell culture, Western blot analysis, ELISA and qRT-PCR. Background research experience is preferred. Mentoring is provided for working with lab techniques, and in principles of experimental design, problem solving, and analysis of results. This research involves the use of human tissue, so Human Subjects and HIPAA training is provided. The goal is for results to be presented at national conferences, and manuscripts prepared for publication. This is an ideal position for someone who recently graduated from college and is applying for medical or graduate school.
